Airbrx Go-to-Market Plan

Draft for the founders · `v3` · updated Nov 3, 2026 · Adam Rogowicz, Product Lead

The short version

- **Who we sell to in November:** finance and reporting teams and agent-heavy builders with real warehouse cost pain (Snowflake, Databricks, Postgres).
- **How a deal moves:** free scan, then a 30-day free pilot on one workload, then a savings statement, then a fixed monthly plan. Abram warms up, Amit closes, FDE work follows.
- **Pricing:** free forever under a usage cap, fixed plans from $299 for most teams, a platform fee plus a meter for Pro and Enterprise, savings shown as proof (Airbrx Pricing Plan).
- **Goal by Dec 17:** 10 customers, approved pricing, proof for the pitch.
- **Needed from founders:** the pricing model and free-tier cap, the savings measurement method, the FDE rate, and Product Lead scope and access (Decisions needed).

Executive summary

Airbrx gets to its first 10 customers by the Dec 17 pitch by finding Snowflake, Databricks and Postgres teams already feeling cost pain, proving savings on one workload, and putting them on a paid plan. Revenue grows from there through flat plans, metered enterprise contracts and forward-deployed engineering (FDE) work.

The plan rests on four bets:

1. **Sell to pain, prove it fast.** Teams with real cost pain pay. The free tier's cap sits low enough that they reach it. Every company pilots free with no charge up front: 30 days by default, extended up to 90 days to help close, especially smaller companies. Once they see the savings, a usage cap moves them to a paid plan. A small free tier for startups and very small companies gets us in the door early, spreads the name and collects real-world data. The free year is a last resort only. Customers move up a plan when they need more tenants, warehouses, users or features.
2. **Sell to the check writer, win the engineer.** The CFO or VP Data hears a bill story in their own unit (credits, DBUs, compute). The engineer hears "one hostname change, fails to pass-through."
3. **Try it, don't buy it.** "Try it" opens doors without pushy selling; cost pain is what turns that into a paid deal. Abram warms up, Amit closes, FDE work follows.
4. **Learn as we sell.** Every conversation updates a customer profile. Profiles drive messaging, pricing and the roadmap.

Phase	When	Goal
Now	Nov to Dec 2026	10 customers, approved pricing, proof for the Dec 17 pitch
Next	Q1 2027	Repeatable funnel after SOC 2 Type II, first case studies, self-serve onboarding

Phase	When	Goal
Later	2027 and beyond	Enterprise and public sector

Confidence labels. Rather than wait for data, this plan drafts now and labels what it is unsure of. **High:** confirmed by customers or founders. **Medium:** some evidence. **Low:** an estimate to refine as conversations come in.

Where we are today

The product is live and cheap to run (~$50/day AWS across all environments). The gap is proof: no public case study, no customer deck, and savings numbers that disagree across materials.

Asset	What we have	Gap
Proof point	Omnigent dogfood: ~1M transactions/day from one user, ~$10/day Airbrx cost vs ~$2,000/day on Databricks, ~1 ms added	Internal test. Needs approval as a labeled claim
Paying customer	PACCAR, $100k, fully self-hosted	Low usage, weak case study
Tenants	All under 10k requests/day (Trillium included)	No baseline vs. after savings data yet
Trust	Credentials never stored, encrypted cache, fails to pass-through, self-host option	SOC 2 Type II expected end of Dec or Jan; pen test outstanding
Onboarding	Signup at airbrx.ai/signup.html; onboarding concept v2	v3 needs on-brand visuals and a clear with/without bill
Savings measurement	Query-history calculator on the website	Not tuned; can't yet split agent and BI traffic from internal jobs
Story	Ben's "less warehouse work" talk, Michael's 2-min video, Data Island video	Customer deck doesn't exist; videos need 1-min cuts
Sales tooling	Abram's CRM, Eva portal ~98% built	Evangelists have no CRM access yet

Savings claims in existing materials range from 20% to 60%. Until real baselines exist, outward materials say "savings depend on usage."

Customer types

November targets two segments: agent-heavy builders and dashboard-heavy finance and reporting teams. Every profile below starts as a hypothesis and moves to "Validated" only after 5 or more real conversations confirm it.

Segments

Segment	Who	Pain and trigger	Stack signal	Entry offer	Confidence
A. Agent-heavy builder	AI-native startups and product teams running agents on their own data	Agents send millions of repeat queries; bills spike with no one watching	Postgres or Databricks behind an agent platform	Free tier if a startup, free pilot otherwise; query history showing agent traffic	Some evidence
B. Dashboard-heavy cost cutter	Mid-market finance, reporting and analytics teams	Power BI and Tableau refreshes rerun the same work all day	Snowflake or Databricks, $10K+/month bill and growing	Free scan, then a savings report on one workload	Hypothesis
C. Enterprise data platform	Fortune 500 data platform owners	Warehouse spend under CFO review, data islands, AI rollout	Large Snowflake or Databricks estate, security review	Self-hosted pilot plus FDE engagement	Some evidence
D. Channel partner	Data consultancies and SIs (Plentiful.ai, Resultant, Slalom)	Their clients' bills; they want a margin and a differentiator	Deliver Snowflake and Databricks projects	Free accounts for their clients, referral or resale terms	Hypothesis
E. Public sector	State and local agencies (Tacoma, Gilbert AZ, San Francisco, Virginia State Police)	Compute cost pressure (GSA OneGov discounts show it)	Snowflake or Databricks; GovRAMP needed	Customer-hosted deployment via a contract vehicle	Hypothesis

Not a fit today: Amazon Athena (ChargeLab), streaming workloads, BigQuery, teams with no repeat BI or agent traffic.

Buying roles

Role	Typical title	Cares about	What wins them
Economic buyer	CFO, VP Finance, VP Data	The bill and predictability	Bill without vs. with Airbrx, in their own unit
Technical owner	Head of Data, data platform lead	Risk, effort, stale data	One hostname change, pass-through on failure, freshness rules
Champion	Analytics engineer, agent builder	Speed and less firefighting	About 10x faster cached answers, query history, blocking rogue agents
Gatekeeper	Security, procurement	Compliance	Credentials never stored, encryption, SOC 2 Type II, self-host
Connector	Former colleagues, consultants, community organizers	Helping their network	An easy intro ask aimed at people with a bill problem

Engineers are the common stall point: they skip the second call because they are already five projects behind. The plan answers this with a hands-on first call where they connect during the meeting.

How profiles get built from real conversations

After each call or message thread, Adam drops raw notes into the Airbrx project. Claude extracts the fields below, tags the segment and role, and updates the matching profile and the evidence log.

- **Fields captured:** company, segment, role, warehouse, monthly bill (range), share of BI vs. agent traffic, pain in their words, objections, buying process, alternatives they considered, next step, disqualifiers.
- **Confidence rule:** Hypothesis (0 conversations), Some evidence (1 to 4), Validated (5 or more that agree).
- **Monthly review:** segments with no evidence after 30 days get cut or reframed.

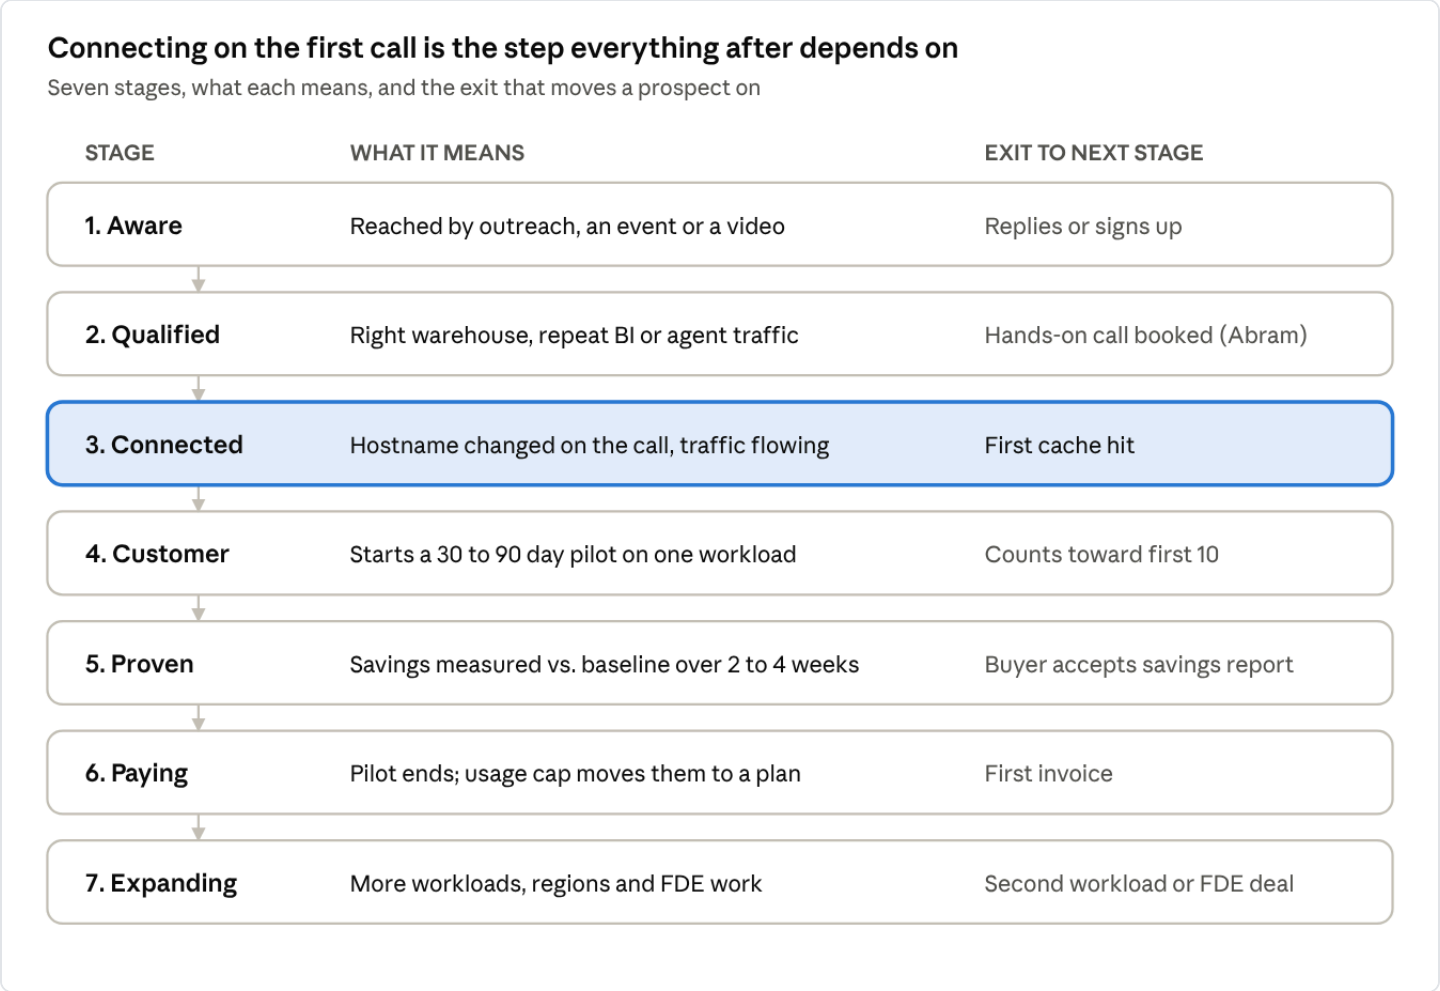

Evidence log

Date	Contact	Segment	What we learned
Oct 30	Omnigent (internal dogfood)	A	~1M transactions/day from one user; looks like an attack but is just product
Oct 26	Kim Phelan, ChargeLab	Not a fit	Athena, little AI traffic; advice: target $10K+/month bills; wants alerts when agent traffic stops or spikes
2026	PACCAR	C	Paid $100k for self-hosted; adoption is the hard part, not the sale

---

The funnel

A prospect becomes a customer when they start a 30 to 90 day pilot with live traffic flowing, and a paying customer when the pilot ends and the usage cap moves them to a plan. Startups on the free tier sit at stage 4 too and are tracked separately until they grow into a plan.

Airbrx funnel: 7 stages from aware to expanding

The free scan is an optional side door at stage 2: it gives cautious buyers a savings estimate before they connect. Stage counts live in the CRM; the Metrics section sets November targets.

Alternatives and how we win

Our toughest competitor is "we already cache" or "we'll tune the warehouse," not another startup. Airbrx wins where repeat traffic comes from dashboards and agents, where data changes often, and where setup has to be one hostname change.

Alternative	What it does well	Where it falls short for our buyer	How we position
Built-in result caches (Snowflake, Databricks SQL)	Free and automatic	Snowflake reuses only exact-match SQL (an alias or lowercase keywords break it), for 24 hours, and drops it when table data changes. Databricks result caches also last 24 hours and clear on table updates	You set freshness rules; cache hits never start the warehouse; one cache across tools and agents

Alternative	What it does well	Where it falls short for our buyer	How we position
Warehouse optimizers (Keebo, SELECT)	Automatic right-sizing, auto-suspend, cost attribution; Keebo cites ~27% average savings	Make each query cheaper, not fewer queries. SELECT says Keebo charges ~40% of savings	Direct rival only if Airbrx offers routing (open question): we would remove repeat work, then route what remains to the right-sized warehouse. We would cover both for less than their ~40% share
Semantic layers with caching (Cube)	Governed metrics, fast pre-aggregated rollups	Pre-aggregations need explicit configuration in a data model: a project, not a hostname change	No modeling; works under the BI tools and agents already in place
BI extracts (Power BI import, Tableau extracts)	Fast dashboards	Stale between refreshes, copies data, no help for agents	Live data with freshness rules, one source of truth
Data islands (scripts copying into local Postgres or Redis)	Cheap, in the team's control	Brittle, ungoverned copies, engineer time	Replaces the scripts (Data Island video)
Proxy result caches (DataSunrise)	Protocol-level caching with masking	Postgres, MySQL, Redshift and similar; not Snowflake or Databricks	Watch for Postgres deals
Do nothing	No new vendor	The bill climbs as agents scale	The free scan shows the repeat traffic

So what:

- Every technical call needs a crisp answer to "how is this different from the result cache?" It goes first in the security FAQ and the deck.
- Compete with Keebo and SELECT, don't partner. Airbrx does caching, and possibly warehouse routing, in one gateway; most plans are a fixed price and large accounts are metered, where Keebo takes ~40% of savings. Use that contrast as the anchor in every pitch.
    - Outstanding **Routing is an assumption.** Whether Airbrx offers warehouse routing at all is an open question. Manual setup by our engineers is assumed, not confirmed.
        - Outstanding **Automated routing:** no confirmed intent to build it.
- Add "What else did you look at?" to every profile so win and loss reasons build up.
- Watch Snowflake and Databricks cache changes, and Cube's agent features.

Competitor facts as of Oct 31, 2026, from the linked pages.

Pricing and packaging

The full model lives in the Airbrx Pricing Plan: plans, features by plan, billing rules, savings measurement and open decisions. That doc is the single source of truth; this section covers only

what sales needs.

Status: revised Nov 3. On Nov 3, Michael and Ben questioned tying price to savings: it can imply the team has been wasting money and invites "we'll fix it ourselves." The Pricing Plan now keeps fixed prices for most teams, steps plans up by tenants, warehouses, users and features, keeps savings on the statement as proof, and makes the free tier free forever with a usage cap. Sales talks about the pilot, fixed plans and the savings statement. Founders still need to approve it.

What sales can say now

- Every company pilots free: 30 days, extendable to 90 to help close. No card.
- At the end of the pilot, the savings statement shows what Airbrx saved and the plan that fits.
- Most paid plans are fixed monthly prices from $299. Larger accounts: "let's talk."
- Startups and very small teams can stay on the free tier forever, under a usage cap.
- Don't say: savings percentages, "you pay only when you save", warehouse routing (an open question, not an offer), or the free year (last resort, founder approval).

The savings statement

Whichever model wins, every dashboard view and invoice shows four lines, in dollars and in the customer's own unit (Snowflake credits, Databricks DBUs):

Line	Example (illustrative)
Owed to Airbrx this month	$299
Warehouse cost avoided	$1,500 (500 DBUs)
Your warehouse bill without Airbrx (estimated)	Actual bill + $1,500
Net savings after Airbrx	$1,201

The test it must pass: if a customer turns Airbrx off for a month, their warehouse bill goes up by about the amount shown.

Commercialization

November runs on warm networks and events; self-serve and partners carry the load from Q1. Each motion ends in the same place: a connected tenant with real traffic and a savings report.

Go-to-market motions

Motion	How it works	Owner	When
Network "just try it"	Evangelists ask their networks to try it; warm intro to a hands-on call with whoever owns the bill	Evangelists, Abram	Now

Motion	How it works	Owner	When
Events	Short slots and expo sign-ups; QR to airbrx.ai/signup.html on the orange shirts	Abram, evangelists	Now
Direct enterprise	Self-hosted pilot, security review, FDE scope	Amit, Michael	Now for warm accounts; broadly after SOC 2
Self-serve	Onboarding page, free scan, connect to bakehouse sample or own warehouse	Product (Adam)	Q1 2027
Partners	Consultancies and SIs bring clients; referral or resale margin	Abram, Adam	Q1 2027
Public sector	Customer-hosted deployment through Carahsoft or NASPO; GovRAMP path	Amit	2027

Who does what

Person	Role in the funnel
Abram	Warm-up calls, hands-on demos, events, CRM
Amit	Closes, contracts, enterprise relationships
Ben	Technical credibility with CTOs, roadmap
Michael	Architecture and security answers, contract terms, FDE delivery
Adam (Product Lead)	Product: pricing, onboarding, the savings statement, customer profiles and the product feedback loop; owns this GTM plan
Evangelists (about 6, including Abram and Adam)	Network outreach, events and sign-ups; warm intros into Abram's hands-on calls

Qualification in four questions

1. Are you on Snowflake, Databricks or Postgres?
2. Do dashboards or AI agents send repeat traffic to it?
3. Roughly what is the monthly bill, and is it growing?
4. Who can change a hostname, and can they join a 30-minute call?

Revenue streams

- **Subscriptions:** flat Team and Business plans.
- **Large-account meter: Pro and Enterprise, basis open (usage or 20% of cost avoided)**.
- **Self-hosted licenses:** PACCAR model ($100k).
- **FDE and consulting:** data islands, rule authoring, regional gateways. Billed through Airbrx.

Partner terms (draft, Low)

- **Referral:** 15% of the customer's first-year subscription for a closed deal.

- **Delivery:** partners can deliver FDE work themselves or bill through Airbrx.
- **First targets:** Plentiful.ai (energy and utilities data), Resultant (built Oregon's Databricks system).

Public sector path (draft, Low)

- **Q1 2027:** SOC 2 Type II in hand, then a GovRAMP Snapshot (gap check).
- **Mid 2027:** GovRAMP Core; first state or local pilot hosted in the agency's own environment, bought through Carahsoft or NASPO.
- **First targets:** City of Tacoma, Town of Gilbert AZ, San Francisco, Virginia State Police, Oregon's longitudinal data system.
- **Federal:** a disconnected edition under an agency's own approval, 2028 at the earliest.

Objection answers

Objection	Answer
"What if you go down?"	It fails to pass-through. You just stop getting the caching advantage. Use a CNAME to switch back in seconds.
"Will people see stale numbers?"	You set freshness: time limits, change detection, any SQL rule. Writes clear the affected cache.
"Do you hold our credentials or data?"	Credentials pass through, never stored. Cache is encrypted and never inspected. Large accounts can self-host.
"Are you SOC 2?"	SOC 2 Type II expected by the end of 2026. Self-hosting removes most concerns today.
"Another meter?"	Small teams get flat monthly plans; Pro and Enterprise get a monthly cap and spend alerts.
"We're too busy"	One hostname change, done on the first call.

Roadmap questions. Answer with what works today and never promise dates. BigQuery: not supported today. Querying open files directly and an AI spend view: on the roadmap, no dates; today Airbrx sits in front of Snowflake, Databricks and Postgres.

Marketing

One message everywhere: Airbrx gives your dashboards and AI agents a memory, so repeat questions stop running up your warehouse bill. Every asset exists to get someone to sign up or book a hands-on call.

Positioning

For finance, data and AI teams on Snowflake, Databricks or Postgres **whose** bills climb as dashboards and agents ask the same questions again and again, **Airbrx is** short-term memory in front of the warehouse **that** answers repeat traffic from cache about 10x faster. **Unlike** warehouse

tuning or copying data into local databases, it takes one hostname change and keeps the warehouse as the source of truth.

Message by buyer

Buyer	Headline	Proof
CFO, VP Finance	Stop paying twice for the same answer	Bill without vs. with Airbrx, from a free scan
Head of Data	Memory for the warehouse, no migration	One hostname change, pass-through on failure, freshness rules
Agent builder	Your agents are hammering the warehouse and nobody's watching	Omnigent: ~1M transactions/day from one user; query history; blocking
Security	Nothing to hand over	Credentials never stored, encrypted cache, self-host

Claims rules

- Approved: "about 10x faster" and "one hostname change."
- No savings percentages until 3 or more customers have before-and-after numbers.
- SOC 2: "Type II expected by the end of 2026." Never "complete."
- Omnigent figures: use only once founders approve them as a labeled internal test.

Assets

Asset	Purpose	Status
Onboarding page v3	15-second money-drain hero, with/without bill, signup	In progress (Adam)
Customer deck	First-call story for buyers	Not started
Security and FAQ one-pager	Forwardable to the decision maker	Answers gathered, needs approval
Cost calculator	Savings in credits, DBUs, compute	Concept; needs real cost data
Omnigent story video, 1 min	"Looks like an attack, it's just product"	Not started
Data Island video, 1 min cut	Shows the copy-to-Postgres workaround	Cut from ~4 min needed
Case study template	Baseline, change, savings, quote	Waiting on first customer

Events

Date	Event	Plan
Nov 4	Portland Fabric User Group (online)	Ask organizer Jason Gregory for a 1 to 2 minute slot or video link
Nov 7	PNW Day of Data, WSU Vancouver (~400 attendees)	Abram speaks ~1 pm; evangelists sign people up at the expo
Dec 17	Pitch event	Abram presents customers and traction
TBD	Omnigent event at Big Pink	Databricks community, agent cost story

---

Customer journey mapping

Draft maps for the two November segments start now (confidence: **Low**). They are built from our call notes, the Oct 28 and Oct 30 meetings and friction we have already seen. Each conversation either confirms a cell or rewrites it; version 2 comes once 5 customers are connected.

Segment A: agent-heavy builder (Low)

Buyer is usually the founder or CTO; champion is the engineer who built the agent.

Stage	What they do	What they think	Touchpoint	Likely friction	What moves them
Aware	Notices a bill spike or slow agent replies	"Is this just us?"	Warm intro, LinkedIn post, 1-min video	Doesn't tie the bill to agent traffic	Omnigent story: looks like an attack, it's just product
Qualified	Checks which backend the agents hit	"Is my traffic repetitive enough?"	Intro call, four questions	No idea of query counts	"Connect it and the query history will show you"
Connected	Swaps the hostname in the agent config on the call	"Will this break my agent?"	Hands-on call, code sample for their tool	Driver or protocol edge cases	Pass-through on failure, ~1 ms added
Customer	Startup takes the free tier; funded team signs a pilot	"Is this worth another vendor?"	Abram, pilot agreement	Small budget, founder signs everything	Free 30 to 90 day pilot, no charge up front
Proven	Watches the audit log and repeat ratio	"Is the saving real?"	Savings report, Iris	Postgres savings hard to put in dollars	Report in their own unit
Committed	Adds agents, moves up a plan	"What happens when we 10x?"	Usage alerts, Amit	Fear of a new meter	Flat plans, 2x upgrade rule

Segment B: dashboard-heavy cost cutter (Low)

Buyer is the CFO or VP Finance; the Head of Data decides whether it gets installed.

Stage	What they do	What they think	Touchpoint	Likely friction	What moves them
Aware	CFO flags the warehouse line in a budget review	"Why is this growing faster than revenue?"	Warm intro, event, CFO one-liner	The data team owns the bill, not the CFO	"Stop paying twice for the same answer"
Qualified	Head of Data is asked to look	"We already have result caching"	Intro call	Result-cache objection; skips the second call	Alternatives answer; connect on the first call
Connected	Runs the free scan or connects one dashboard workload	"Security will block this"	Free scan, security FAQ	Running SQL from a website; security review	Credentials never stored, self-host, SOC 2 date
Customer	CFO approves a small pilot	"What if it saves nothing?"	Pilot agreement	Procurement for a small vendor	Free 30 to 90 day pilot, no charge up front
Proven	Compares the bill before and after	"Can I show this to my CEO?"	Savings report in credits or DBUs	Warehouses billed on uptime only show savings if they suspend more	Report shows warehouse hours avoided
Committed	Signs an annual plan, adds the next dashboard set	"What else can this do?"	Amit, FDE scoping	Data team bandwidth	FDE work to tear down data islands

Buying roles C to E get draft maps after the first enterprise or partner conversation.

Friction already seen (the evidence behind the drafts):

- Per-GB pricing confuses buyers who think in credits or DBUs.
- Engineers skip the second call; setup has to happen on the first.
- The free scan asks people to run SQL from a website, which is hard to trust cold.
- The rules engine is hard to understand; having the customer's own AI write rules through the MCP is the likely fix.
- Switching tenants in the admin app means going back to the tenant tab.

How the maps get refined. After each call, notes update the matching row; a cell confirmed by 3 conversations moves to Medium, by 5 to High. Maps are reviewed monthly with the customer profiles.

Metrics and 90-day plan

The north star is warehouse dollars avoided for customers, because it drives renewal and upgrades. Week to week, we watch conversion between funnel stages.

Metric	Definition	Nov target
Conversations	Qualified first calls held	30

Metric	Definition	Nov target
Connected tenants	Hostname changed, live traffic flowing	15
Customers	Active pilot with live traffic or paid plan (paid shown separately)	10
Time to first cached query	Signup to first cache hit	Under 30 minutes
Dollars avoided	Estimated warehouse cost saved, per tenant per month	Baseline set for every tenant

Targets work back from 10 customers; they are a starting point to revise after two weeks of data.

Next 90 days

Date	Milestone	Owner
Nov 2	Abram's 25 calls begin; Adam's list loaded in CRM	Abram, Adam
Nov 3	Follow-ups on Adam's Oct 29 outreach	Adam
Nov 4	Fabric User Group slot	Abram, Adam
Nov 7	PNW Day of Data sign-ups	Evangelists
Nov 13	Pricing model approved; free-year terms in the contract	Founders
Nov 20	Onboarding v3 and security one-pager live	Adam, Michael
Nov 30	10 customers signed	Abram, Amit
Dec 17	Pitch with customers and early savings data	Abram
End Dec to Jan	SOC 2 Type II certificate	Michael
Jan 2027	First case study, journey maps v2 from real customers, Q1 self-serve plan	Adam

---

Decisions needed from the founders

Eight decisions unblock November. Each has a recommendation to react to.

- [ ] **Pricing model.** Recommend: free pilot for every company (30 days, up to 90 to close), then fixed plans through Business and a platform fee plus meter on Pro and Enterprise, with savings as proof (see the Airbrx Pricing Plan doc).
- [ ] **Free year as a closing tool.** Last resort only: founder approval, a large stuck deal. Set the free-tier usage cap (Michael's starting point: 10k to 20k requests/day).
- [ ] **What counts as a customer for Dec 17.** 30-day pilots started in early November can convert before Dec 17; extended ones will not. Recommend: count active pilots with live traffic, and show paid plans and pilot savings as separate lines.
- [ ] **Approved claims.** Omnigent numbers, savings percentages, SOC 2 wording.

- [ ] **November focus.** Recommend: agent-heavy builders and finance or reporting teams first.
- [ ] **FDE and consulting.** Rate, who delivers, and how evangelists share in it.
- [ ] **Brand.** "Airbrx" as the written name; trademark timing.
- [ ] **Adam's role.** Product Lead scope, airbricks.com email, CRM or Eva access, admin app and repo access.

From draft to final

The plan becomes final when the founders sign off on the decisions above and every Low-confidence number is replaced with tenant or customer data. Target: final by Nov 20.

Action	Owner	Why it's needed	Due	Status
Sign off on the eight decisions above	Founders	Turns draft pricing and claims into final	Nov 13	Not started
Share requests/day and warehouse for every current tenant	Ben	Shows which plan real customers land in	Nov 8	Not started
Confirm Airbrx can measure dollars avoided per tenant (plans depend on it)	Adam, founders	Plans that match real companies	Nov 13	Not started
Check plan limits, prices and the free-tier cap against tenant data	Adam, Michael	Replaces the draft limits	Nov 13	Not started
Pilot agreement template: 30 days, extension to 90, cap after	Amit	Every pilot needs one	Nov 13	Not started
Process for pilot end dates and caps, manual until the product does it	Abram, Michael	November pilots end in December	Nov 30	Not started
Agree how savings are measured (DBU attribution)	Michael, Adam	Savings reports and the 2x rule depend on it	Nov 20	Not started
Savings report template	Adam	Proves value when a pilot ends	Nov 20	Not started
Approve claims: Omnigent numbers, SOC 2 wording	Founders	Marketing assets wait on it	Nov 13	Not started
Security FAQ, onboarding v3, customer deck	Adam, Michael, Abram	Assets for first calls	Nov 20	In progress
Agree how Dec 17 counts customers	Abram	The pitch story	Nov 13	Not started
5 conversations each in segments A and B	Evangelists, Adam	Moves profiles and journey maps off Low	Dec 15	Not started

On every call from now on, ask for the monthly warehouse bill and the number of agents hitting it.
