AiRBRX PRD: Features and Commercial Launch

Draft for the founders · `v3` · updated Nov 3, 2026 · Adam Rogowicz, Product Lead

TL;DR

AiRBRX needs 10 customers by Nov 30 and proof of savings for the Dec 17 pitch, but today it cannot show any customer what it saved them in dollars. This PRD scopes the product work that turns the GTM plan into revenue: **measure warehouse cost avoided per tenant, show it in the customer's own unit, and run every account through a free pilot into a fixed monthly plan, with savings shown as proof.** Onboarding v3 and funnel tracking get prospects to a first cached answer in under 30 minutes.

Owner	Adam Rogowicz, Product Lead
Stage	Problem agreed in GTM plan; solution in draft; pricing awaits founder sign-off (target Nov 13)
Risk tier	**High.** The savings statement, ROI story and renewals all depend on the savings number. Full PRD, not a one-pager (rule 10).
Scope	Launch: savings metering and statement, free scan, pilot-to-paid lifecycle, onboarding v3, funnel tracking
Beyond launch	Every other feature, settled or not: routing, platform roadmap, plan-tier features. All in the feature catalog (section 8) with a status

Build principle: manual first, product second. November runs on spreadsheets, FDE setup and a hand-built savings report. Each manual step becomes a requirement once it repeats.

Living doc. Features are proposed and discussed here, including ones that aren't settled. Each one carries a status in the feature catalog (section 8): Live, Launch (proposed), Not settled, Team roadmap or Parked. The Pricing Plan and GTM plan should point here for features; they haven't been updated yet.

Check my understanding. This is written from outside the codebase. What is marked Live, and how things work today, comes from conversations with Michael and Abram. If anything is wrong or missing, comment on it and I'll fix it. Launch and Not settled items are proposals for discussion, not decisions.

1. Problem

Teams on Snowflake, Databricks and Postgres pay their warehouse to answer the same questions again and again, and AiRBRX cannot yet prove how much of that bill it removes. Without a trusted savings number, buyers will not pay, pricing cannot be set by value, and the Dec 17 pitch has no customer proof.

Who feels it

- **Buyers:** dashboards (Power BI, Tableau) rerun the same work all day; AI agents send millions of repeat queries and keep warehouses awake 24/7. The CFO sees the bill climb faster than revenue.
- **AiRBRX:** every current tenant runs under 10k requests/day, no tenant has a before-and-after baseline, and savings claims across materials range from 20% to 60%.

Evidence

Signal	Source	What it shows
Omnigent dogfood: ~1M transactions/day from one user; ~$10/day AiRBRX cost vs ~$2,000/day on Databricks; ~1 ms added	Michael, Oct 30	Agent traffic is massively repetitive. Internal test, not yet an approved claim.
"Per-GB pricing confuses me"; buyers think in credits and DBUs	Adam, Oct 30 meeting	Price must map to the bill line the buyer already reads
Engineers skip the second call	Oct 30 meeting	Setup has to happen on the first call, in under 30 minutes
Running a SQL scan from a website is hard to trust cold	Michael, Oct 30	Scan must return totals only, no query text, no signup
ChargeLab: agent feature down a month unnoticed; target $10K+/month bills	Kim Phelan, Oct 26	Agent monitoring is a hook; ICP floor around $10K/month
PACCAR paid $100k, self-hosted, low usage	GTM plan	Selling is possible; adoption and proof are the gap
Website calculator can't split agent and BI traffic from internal jobs	Oct 30 meeting	Measurement must use gateway data, not query history alone

Why now

- **Dec 17 pitch:** Abram will not pitch without customers. A Salt Lake VC's advice: "just get 10 customers."
- **Agents are scaling warehouse spend now.** "When we invented this it was a person in front of Tableau, 400 queries a day. Now agents do a million a day."
- **Pricing decision is due Nov 13.** The proposed model only works if savings can be metered.

Evidence gaps (flagged, not invented): no measured cost avoided for any tenant; no time-to-first-cache-hit data; no pilot-to-paid conversion history.

---

2. Target segments

v1 is built for two segments: agent-heavy builders (A) and dashboard-heavy cost cutters (B). C to E use the same product but are not designed for in this release.

Segment	Who	Trigger	v1 must deliver	Confidence
A. Agent-heavy builder (primary)	AI-native startups and product teams; founder or CTO buys, agent engineer champions	Agents send millions of repeat queries; bills spike unnoticed	Hostname swap in agent config on the first call; audit log; savings in dollars even on Postgres	Some evidence (Omnigent)
B. Dashboard-heavy cost cutter (primary)	Mid-market finance and reporting teams; CFO buys, Head of Data installs	Power BI and Tableau refreshes rerun the same work; $10K+/month bill	Free scan, one-workload pilot, savings report in credits or DBUs a CFO can check	Hypothesis
C. Enterprise data platform	Fortune 500 data platform owners	Spend under CFO review, data islands	Self-hosted pilot, FDE scope (served by existing deploy scripts)	Some evidence (PACCAR)
D. Channel partner	Consultancies and SIs	Client bills, margin	Free accounts for clients; referral terms	Hypothesis
E. Public sector	State and local agencies	Compute cost pressure	Customer-hosted deploy; GovRAMP	Hypothesis

Not a fit: Amazon Athena, BigQuery, streaming workloads, teams with no repeat BI or agent traffic.

Buying roles v1 must satisfy: economic buyer (bill without vs. with AiRBRX), technical owner (one hostname change, pass-through on failure, freshness rules), champion (about 10x faster, audit log), gatekeeper (credentials never stored, SOC 2 Type II expected end of 2026, self-host).

---

3. Success metrics

North star: warehouse dollars avoided per tenant per month. It drives renewal and upgrades, so it is defined before any feature.

Metric	Type	Definition	Baseline today	Target	When measured
Dollars avoided	North star	Estimated warehouse cost saved per tenant per month, in $ and credits/DBUs	Not measured for any tenant	Baseline set for 100% of pilots; reported weekly	Weekly from pilot start
Savings accuracy	Guardrail	Gap between statement and bill change in a pause test or control group	None	Within 10% (Low confidence)	First reconciliation, Jan 2027
Customers	Lagging	Active pilot with live traffic, or paid plan (paid shown separately)	1 paid (PACCAR), several low-volume tenants	10 by Nov 30	Nov 30, Dec 17
Connected tenants	Leading	Hostname changed, live traffic flowing	Unknown	15 in November	Weekly

Metric	Type	Definition	Baseline today	Target	When measured
Time to first cached query	Leading	Signup to first cache hit	Not tracked	Under 30 minutes, no call needed (median)	From funnel events go-live
Qualified conversations	Leading	First calls held that pass the four questions	0 tracked	30 in November	Weekly
Pilot-to-paid conversion	Lagging	Pilots that pick a plan within 14 days of pilot end	No history	**Missing: proposed 50%** for founders to confirm	Each pilot end
Upgrade prompts accepted	Lagging	2x-rule prompts that lead to a plan change	None	Set after first 10 paid accounts	Quarterly

Guardrails: p95 latency added on a miss stays at ~1 ms; zero incidents of stale data served outside a customer's freshness rules; zero credentials stored.

Targets work back from 10 customers and get revised after two weeks of data.

---

4. Goals and non-goals

Goals

1. **Prove savings per tenant.** Every pilot has a baseline and a weekly dollars-avoided figure in its own warehouse unit by pilot day 7.
2. **Get to first value fast.** Median signup to first cache hit under 30 minutes, without a call.
3. **Turn pilots into revenue.** Every pilot ends with a savings report and a plan recommendation; non-converters drop to the free-tier cap automatically.
4. **Make the bill auditable.** A customer can trace any statement line to per-query hits and the method used.
5. **Land 10 customers by Nov 30** with the manual version, and automate it by end of Q1 2027.

Non-goals

Non-goals apply to the launch release only. Each one stays in the feature catalog so it can still be discussed here.

Non-goal	Why
DuckDB routing, AI token gateway, hosted Databricks, AiRBRX AI/BI	Founders' roadmap; does not help land 10 customers. Answer roadmap questions with "no dates."
Automated (AI) warehouse routing	Not settled whether AiRBRX offers routing at all, manual or automated. Discussed in the feature catalog.
Opt-in billing connection with a stored read-only credential	Conflicts with "we never store credentials." Parked (P-19).

Non-goal	Why
Fully disconnected self-hosted mode	Federal only; revisit after SOC 2 and GovRAMP (P-18).
BigQuery, Athena, streaming support	Not a fit today.
Self-serve card checkout in November	10 customers close by hand; invoice manually until Q1.
Evangelist CRM or portal	Abram's Eva portal is ~98% built. Do not duplicate.
Savings percentages in marketing	Not until 3+ customers have before-and-after numbers.

5. Owner and RACI

Single owner: Adam Rogowicz (Product Lead). R = does the work, A = signs off, C = consulted, I = informed.

Workstream	Adam	Michael	Ben	Abram	Amit	Founders
PRD, requirements, savings report template	A/R	C	C	C	I	I
Pricing model and plan bands	R	C	C	C	C	A
Savings metering in the gateway	C	A/R	R	I	I	I
Free scan (Snowflake, Databricks, Postgres)	R	A	C	C	I	I
Onboarding v3 and guided connect	A/R	C	R (admin app)	C (animation)	I	I
Funnel events and dashboard	A	C	R	C	I	I
Pilot lifecycle (timers, extensions, cap)	A	R	R	R (approves extensions)	R (approves extensions)	I
Pilot agreement, invoices, contracts	C	C	I	I	A/R	C
Claims and security wording	R	C	I	C	I	A
FDE routing setup (Phase 0)	C	A/R	C	I	I	I

6. GTM plan summary

AiRBRX gets to 10 customers by Dec 17 by finding teams already in cost pain, proving savings on one workload, and moving them to a paid plan. Full plan: Airbrx Go-to-Market Plan (Oct 31 draft, final targeted Nov 20).

- **Segments:** agent-heavy builders and dashboard-heavy finance teams first; enterprise, partners and public sector later.
- **Motions:** network "just try it" and events now; self-serve and partners in Q1 2027; public sector in 2027.
- **Funnel:** Aware > Qualified > Connected > Customer (pilot) > Proven > Paying > Expanding. The free scan is a side door for cautious buyers.

- **Positioning:** memory for dashboards and AI agents. Compete with Keebo and SELECT (fixed for most teams, vs Keebo's ~40% of savings).
- **November targets:** 30 qualified conversations, 15 connected tenants, 10 customers, first cached query in under 30 minutes.

What this PRD owes the GTM plan: a savings report, a pilot, a plan ladder and a 30-minute first call that actually work.

---

7. Pricing summary

Every company starts on a free pilot; most paid plans are fixed monthly prices stepped by tenants, warehouses, users and features; Pro and Enterprise add a meter. Savings show as proof. Internal draft for the founders; structure Medium confidence, numbers Low. Full detail: Airbrx Pricing Plan.

- **Plans:** Free forever (usage cap, level open), Team $299, Team Plus $699, Business $1,999, Pro $2,999 + meter, Enterprise $8,999 + meter. Features step up by plan (tenants, warehouses, freshness rules, audit log and SSO on Pro, self-hosting and SLAs on Enterprise).
- **Pilot:** free for any size, 30 days, extendable to 90 to close. No plan chosen means the free tier; queries keep passing through.
- **Moving between plans:** move up when the customer needs more tenants, warehouses, users or a higher-plan feature; customer confirms.
- **Savings statement:** four lines in dollars and credits or DBUs, testable against the real bill (draft target: within 10%).
- **Revised (Nov 3):** following Michael and Ben, fixed plans are not tied to savings ("can feel like a trap"). Pro and Enterprise keep a meter; its basis is open (usage or 20% of cost avoided). Accurate savings metering is needed for billing only if the meter is a savings share.
- **Routing is an assumption,** not a confirmed offer, manual or automated.

What pricing needs from the product: R2 to R4 (metering and statement), R9 and R10 (pilot and cap), R11 and R13 (plan engine and budget caps). Under the neutral alternative, R10 and R11 switch from savings to usage limits. Rejected pricing options are in section 9; open pricing items in section 12.

---

8. Solution

Price every cache miss as it runs, credit that cost on every later hit, and show the total as a statement line the customer can test. Around that meter sit the free scan (baseline), guided connect (first value), the pilot lifecycle (conversion) and the plan engine (expansion).

How savings are measured (proposed, to confirm with Michael)

1. On a cache miss, log duration, warehouse ID, warehouse query ID and cache key.

2. Cost of the miss = duration x warehouse rate (credits or DBUs per hour, from size and type, set at onboarding or read from the API). Snowflake: QUERY_ATTRIBUTION_HISTORY. Databricks: system.billing.usage split by total_task_duration_ms.
3. Every later hit on that key credits the same cost.
4. Wake-ups avoided: when a hit lands while the warehouse is likely asleep, credit the minimum charge plus the idle tail before auto-suspend.
5. Billable savings count only compute that changes the bill (uptime-billed warehouses must suspend more or downsize). Reconcile monthly against the actual bill.

User stories

Economic buyer (CFO, VP Finance)

- As a CFO, I want to see my warehouse bill with and without AiRBRX in credits or DBUs, so I can check it against the invoice from Snowflake or Databricks.
- As a CFO, I want a pilot that costs nothing and ends with a plan recommendation, so I can approve it without procurement.
- As a Pro or Enterprise buyer, I want a monthly budget cap and spend alerts, so the meter never surprises me.

Technical owner (Head of Data, platform lead)

- As a Head of Data, I want to run a read-only scan that returns totals only, so I can estimate savings without signing up or exposing query text.
- As a platform lead, I want to connect my own warehouse and point one tool at the gateway in under 30 minutes, so setup happens on the first call.
- As a platform lead, I want to audit any savings figure down to the query, time of each hit and estimate method, so I can defend the invoice.

Champion (agent builder, analytics engineer)

- As an agent builder, I want a code sample for my tool after picking it from a list, so I can swap the hostname without reading docs.
- As an agent builder, I want an alert when my agent's traffic stops or spikes, so I find outages and runaway agents before the bill does.

AiRBRX team (Abram, Amit, FDE)

- As Abram, I want to see every pilot's days left, savings to date and recommended plan, so I know who to call this week.
- As Amit, I want to extend a pilot to 60 or 90 days with one action and a logged reason, so extensions stay controlled.
- As Adam, I want funnel events from signup to first cache hit, so I can find where onboarding loses people.

Edge cases: traffic that bypasses the gateway; Postgres with no per-query bill; a warehouse the gateway cannot see; pilot ends mid-month; customer turns AiRBRX off; statement disputes.

Must-have (P0)

ID	Requirement	Acceptance criteria	Depends on
R1	**Log miss inputs.** Record duration, warehouse ID, warehouse query ID, cache key on every forwarded query	100% of misses carry all four fields; no query text or credentials added to logs	Michael: what the audit log stores today
R2	**Live savings estimate per tenant.** Price each miss; credit on later hits; total per day and month	Given a key that missed once at cost X, when it hits N times, then savings = N x X; shown in $ and credits/DBUs; method version stamped	R1, warehouse rate at onboarding
R3	**Savings statement.** Four lines: owed, cost avoided, bill without AiRBRX (est.), net savings, in $ and native unit	Same four numbers on dashboard and invoice; every figure labeled "estimate"; Postgres shown as estimated compute hours	R2
R4	**Auditable savings log.** Per-query view: query, time of each hit, estimated cost, method	Customer can export a month to CSV; totals match the statement to the cent	R2
R5	**Free scan, Snowflake and Databricks.** Read-only SQL on the prospect's query history, no signup	Returns totals only (repeat rate, compute hours, est. $); no query text leaves the account; runs in under 5 minutes on 30 days of history	Test on Bakehouse
R6	**Guided connect.** After signup: tenant and gateway URL; tool dropdown (Power BI, Tableau, agent, JDBC, other) shows a code sample; own warehouse by default, Bakehouse sample next, free Databricks account last	A new user reaches a first cache hit without a call; each dropdown option renders a working sample	Ben: admin app
R7	**Onboarding v3 page.** One screen, no scroll: memory headline, money-drain animation ending on bill without vs. with, signup CTA; trust content below the fold	Visitor understands it in 15 seconds (5-person hallway test); on-brand per Michael; airbrx.ai/signup.html; only approved claims	Abram: animation
R8	**Funnel events.** Signed up, tenant created, connected, first cache hit, pilot started, plan chosen	Events timestamped per tenant; median time to first cache hit visible weekly	Ben
R9	**Pilot lifecycle.** Start date, length (30/60/90), extensions with approver and reason, weekly snapshot, end-of-pilot report	Extension requires Abram or Amit; report generated at day N-3; manual spreadsheet acceptable through Nov 30	R2
R10	**Post-pilot cap.** No plan chosen: caching stops above the free-tier cap; queries pass through	Cap enforced in $ avoided once R2 is trusted; until then a cached-request limit stand-in; customer warned at 80% and 100%; no query ever fails because of the cap	R2, pricing decision

Nice-to-have (P1), fast follow

ID	Requirement	Acceptance criteria
R11	**Plan engine and 2x prompts.** Trailing 3-month placement; prompt when savings are 2x the next plan for 2 months	Prompt shows the math; customer confirms; no automatic upcharge
R12	**Wake-ups avoided.** Infer warehouse state; credit minimum charge plus idle tail	Shown on its own line until validated by a pause test
R13	**Meter controls (Pro, Enterprise).** Monthly budget cap and spend alerts on the meter	Alert at 80%; share never billed above the cap
R14	**Agent spike and stop alerts.** Alert when a source's traffic drops to zero or exceeds its normal range	Email alert within 1 hour; customer sets thresholds
R15	**Free scan, Postgres;** Databricks native scan app (team roadmap)	Same outputs as R5
R16	**Invoice generator.** Statement to invoice, annual prepay, meter in arrears	Manual invoices until shipped
R17	**Monthly reconciliation and proof.** Control group (small random share of repeats passes through) or customer-requested pause test	Variance reported; target within 10%
R18	**Tenant switching fix** in the admin app	Switch tenants from any page

Future (P2), design for, don't build

- **If routing is offered (not settled): a routing savings line** for FDE-routed customers, then Phase 1 rules-based routing between existing warehouses. Keep the savings schema source-tagged (cache, wake-up, routing).
- **AI-written caching rules via MCP** (customer's own AI writes rules).
- **Opt-in billing connection with nightly true-up**, if a credential model that keeps "never stored" becomes possible.
- **Self-serve checkout** with card billing for Team to Business.
- **Customer feedback log** in the admin app.

Feature catalog

Every AiRBRX feature lives here, settled or not, so features are discussed in one place. Status: **Live** ships today; **Launch (proposed)** is in this PRD's P0 or P1, pending founder review; **Not settled** is an open idea or waits on an open decision; **Team roadmap** is the founders' list, no dates; **Parked** is set aside. Comment on a row to discuss it, change its status from the dropdown, and log status changes in section 11.

Area	Feature	What it does	Status	Ref
Core	Memory (caching gateway)	Answers repeat traffic from cache about 10x faster; one hostname change; Snowflake, Databricks, Postgres	Live	

Area	Feature	What it does	Status	Ref
Core	Freshness rules	Time limits, change detection, PII rules, custom SQL. Which rules sit on which plan is not settled	Live	
Core	Fail to pass-through	If AiRBRX degrades, queries go straight to the warehouse	Live	
Core	Rogue agent blocking	Blocks credential guessing and runaway agents with 403s. Custom policies on Pro not settled	Live	
Core	Audit log	Every query, transaction level. 1-year retention and export on Pro not settled	Live	
Core	Self-hosted and regional deploy	Customer's own AWS (PACCAR), same-region gateways, account kill switch	Live	
Core	Iris in the admin app	Embedded AI: tenant view, health, rules, chat; folding into the admin app	Team roadmap	T-05
Measure	Live savings estimate	Price each miss, credit every later hit, per tenant	Launch (proposed)	R1, R2, P-03
Measure	Savings statement	Four lines in dollars and credits or DBUs on dashboard and invoice	Launch (proposed)	R3
Measure	Auditable savings log	Per-query hits, estimated cost and method; CSV export	Launch (proposed)	R4, P-05
Measure	Wake-ups avoided	Credit the minimum charge plus idle tail when a hit avoids waking a warehouse	Not settled	R12, P-04
Measure	Reconciliation and proof	Control group or pause test; monthly check against the real bill	Not settled	R17
Measure	Billing connection true-up	Scoped read-only role replaces estimates; conflicts with "never store credentials"	Parked	P-19
Acquire	Free scan, Snowflake and Databricks	No-signup, totals-only scan of query history	Launch (proposed)	R5, P-06
Acquire	Free scan, Postgres	Same scan for Postgres	Not settled	R15
Acquire	Databricks native scan app	The scan, running inside Databricks	Team roadmap	P-07
Acquire	Calculator in the buyer's units	Savings in credits, DBUs or compute hours	Launch (proposed)	P-08
Acquire	Onboarding v3 page	15-second money-drain hero, bill with vs without, signup	Launch (proposed)	R7, P-14
Acquire	Guided connect	Tenant URL, tool dropdown with code sample, own warehouse first	Launch (proposed)	R6, P-13

Area	Feature	What it does	Status	Ref
Acquire	Funnel events	Signup to first cache hit; time to first value	Launch (proposed)	R8, P-10
Plans	Pilot lifecycle	30, 60 or 90 days, approvals, weekly snapshot, end report	Launch (proposed)	R9
Plans	Free-tier cap	Caching stops above the cap; queries pass through. Savings or usage basis not settled	Launch (proposed)	R10
Plans	Plan engine and 2x prompts	Placement and upgrade prompts with the math; depends on the pricing model	Not settled	R11, P-11
Plans	Usage alerts	Alerts at 80% and 100% of plan or cap	Launch (proposed)	P-11
Plans	Budget caps on metered plans	Monthly cap and spend alerts on the meter	Not settled	R13, P-15
Plans	Invoices from statements	Flat fee, annual prepay, share billed in arrears	Launch (proposed)	R16
Plans	Plan-tier features	Tenants, warehouses, users, SSO/SAML, SCIM, SIEM export, uptime SLA by plan	Not settled	Pricing Plan
Plans	Neutral pricing limits	Plans step by tenants, warehouses, users and features; free forever with a usage cap	Not settled	Q17
Operate	Agent spike and stop alerts	Alert when a source goes quiet or spikes	Not settled	R14, P-02
Operate	Overnight cache warm-up	Pre-aggregate overnight or at first run	Not settled	P-16
Operate	AI-written caching rules via MCP	Customer's own AI writes the rules	Not settled	P-09
Operate	Bring your own AI	Claude plugin with Iris skills, on the customer's subscription	Team roadmap	T-06
Operate	Tenant switching fix	Switch tenants from any page	Launch (proposed)	R18, P-12
Operate	Customer feedback log	In-app feedback loop to product	Not settled	P-17
Route	Manual routing (FDE)	FDE maps sources to warehouses the customer already runs; free for small customers at launch	Not settled	P-01, Q16
Route	Rules-based routing	Customer maps sources to existing warehouses; falls back to the original	Not settled	P-01, Q16
Route	AI routing	Per-query routing by predicted run time, load and wake-up cost; auto-sizing	Not settled	P-01, Q16

Area	Feature	What it does	Status	Ref
Route	Routing savings line	Routing savings on their own statement line; billed only once proven	Not settled	P-01, Q16
Route	DuckDB routing	Cache, then DuckDB on open files, then the warehouse; demo exists	Team roadmap	T-01
Platform	AI token gateway	Token spend, warehouse spend and savings in one view	Team roadmap	T-02
Platform	Hosted Databricks with AiRBRX	Managed compute in front of AiRBRX for smaller customers	Team roadmap	T-03
Platform	AiRBRX AI/BI	Conversational dashboards; possible spinoff	Team roadmap	T-04
Platform	Disconnected self-hosted mode	No phone-home, for federal buyers without FedRAMP	Parked	P-18
Platform	BigQuery support	Deprioritized; it works differently	Parked	

9. Options considered and rejected

Recorded so nobody reopens them without new evidence.

Option	Proposed by	Why rejected
Price only at 10 cents per GB of cache hits	Abram, Oct 28	GB does not map to credits or DBUs; buyers can't compare it to their bill. BigQuery on-demand is $6.25/TiB, far below the calculator's $1/GB assumption.
Four ABU meters (storage, hit, miss, rule evaluation)	Michael, Oct 30	Matches AiRBRX's cost, but adds another meter for buyers to fear. Kept as internal cost model, not the price.
Free for a year under 10k to 20k requests/day as the lead offer	Michael, Oct 30	Every current tenant is under 10k/day, so it gives away the paying segment. Kept only as a last-resort closer.
Adam's earlier per-GB meter and request-based tiers	Adam, Oct 29	Requests don't track value; a 1M/day Postgres agent and a 10k/day Databricks dashboard save very different amounts.
Partner with Keebo, Espresso AI or Yuki for routing	Considered Nov 2	Splitting savings weakens the fixed-price story. Compete, don't partner.
Read billing tables via a stored read-only credential	Adam, Oct 29	Conflicts with "we never store credentials." Parked as P-19.
Push a free Databricks account first in onboarding	v1 prototype	Abram: connect the customer's own warehouse first; free account is the fallback.
Lead messaging with the data cube	v1 prototype	Lead with memory; cube is the how, not the headline.

Option	Proposed by	Why rejected
Only two prices (free and paid)	Abram, Oct 30	Leaves a big gap between $0 and enterprise; the 2x ladder keeps every plan justifiable. Open for founders to revisit Nov 13.

10. Risks and mitigations

The biggest risk is that savings can't be measured per tenant to a testable accuracy; the whole pricing model rests on it.

Risk	Likelihood	Impact	Mitigation
Savings can't be measured reliably per tenant	Medium	Critical	Answer from Michael by Nov 13. Fallback: request-based bands. Label every figure an estimate; bill only caching savings until proven.
Uptime-billed warehouses show no bill change even with high hit rates	High	High	Count only compute actually avoided; pair caching with wake-ups avoided and FDE routing so the warehouse suspends more or downsizes.
Traffic that bypasses the gateway hides the true baseline	High	Medium	Free scan covers full query history; statement scoped to gateway traffic and says so.
10 customers by Nov 30 slips	High	High	Count active pilots with live traffic for Dec 17 (founder decision); manual pilot ops so engineering isn't the bottleneck.
Savings statements get disputed	Medium	High	Auditable savings log (R4), method on every statement, budget caps (R13), reconciliation (R17).
SOC 2 Type II slips past January	Medium	Medium	Self-hosted option for enterprise; say "expected by end of 2026," never "complete."
Prospects won't run SQL from a website	Medium	Medium	Totals-only scan, no query text leaves the account; offered in trusted, guided calls; Databricks native app later.
Postgres savings are guesses	High	Medium	Show as estimated compute hours; decide Postgres pricing basis (open).
If routing is offered: free FDE routing for small customers becomes permanent consulting	Medium	Medium	Cap FDE hours per small customer; every repeated FDE step becomes a Phase 1 rule; exit after 5 FDE-routed customers or end of Q1.
Cap enforcement breaks a customer's queries	Low	Critical	Cap only turns caching off; queries always pass through.
Pilots started in November end after Dec 17	High	Low	Report pilot savings separately from paid plans in the pitch.

11. Decision log

Newest first. Pending calls stay in section 12 until made.

Date	Question	Call	Who
Nov 3	Scope of this PRD	Savings metering, free scan, pilot-to-paid, onboarding v3, funnel; manual first	Adam
Nov 2	Partner or compete on routing?	Compete. Caching plus routing for a 20% share.	Adam (GTM plan)
Nov 2	FDE fees for small customers?	None during launch, including manual routing setup. Launch policy, can change.	Adam (GTM plan)
Nov 1	What sets plan placement?	Measured cost avoided, not requests; requests are fair use only. Pending founder sign-off.	Adam (proposal)
Nov 1	Pilot terms	Free for every size, 30 days default, extend to 90 to close, then cap. Pending founder sign-off.	Adam (proposal)
Oct 31	Lead with free under 10k to 20k/day?	No. Sell to cost pain; free tier only for startups and very small companies.	Adam
Oct 30	No-signup free scan?	Yes, totals only.	Michael agreed
Oct 30	Gateway failure behavior	Fails to pass-through; CNAME for failover.	Michael
Oct 29	Onboarding steps	Sign up > Connect > Point your tool > See your savings; Learn and Sign up on one page.	Adam
Oct 28	Lead message	Memory, not the cube.	Abram
Oct 28	Approved claims	"About 10x faster," "one hostname change."	Abram
Oct 28	Upgrade trigger	Recommend a plan once savings reach 2x its price (received positively).	Adam, Abram

12. Open questions

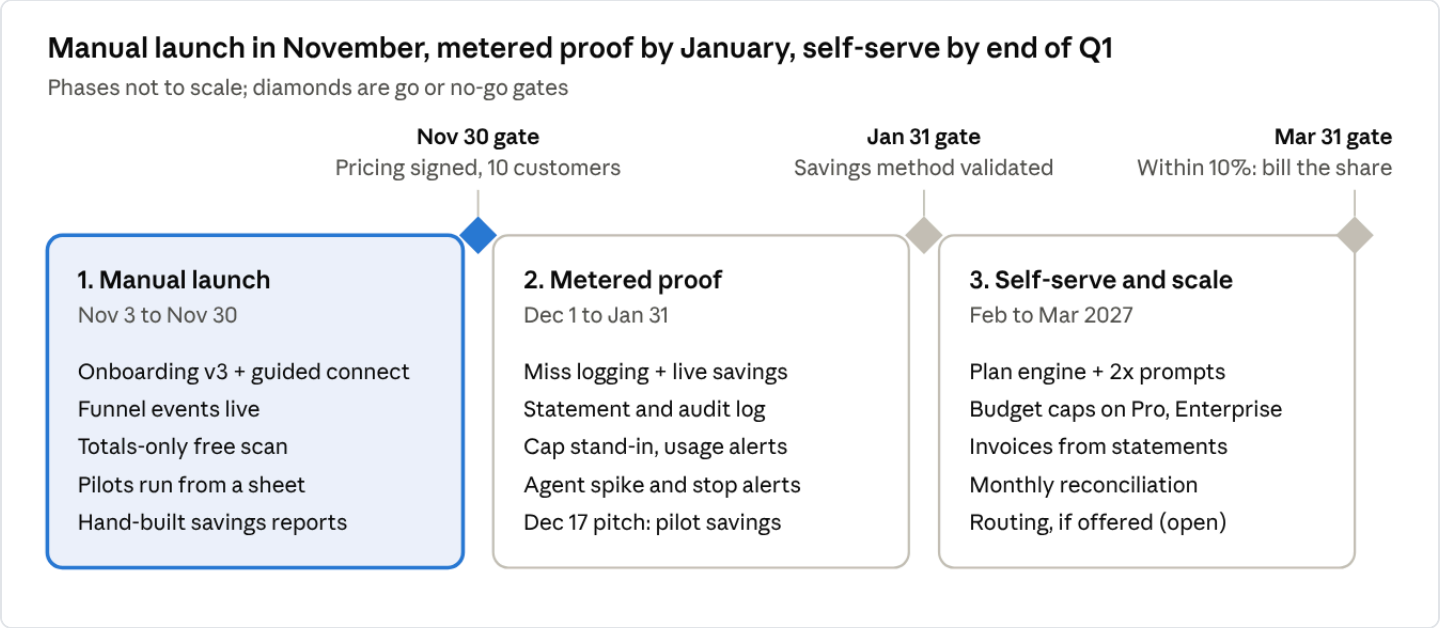

Four blocking questions decide whether R2 and R10 can ship as written.

#	Question	Owner	Blocking?	Needed by
Q1	Does the audit log record duration, warehouse ID and warehouse query ID per forwarded query today?	Michael	Yes (R1, R2)	Nov 13
Q2	Can AiRBRX measure dollars avoided per tenant, and to what accuracy?	Michael, Adam	Yes (whole pricing model)	Nov 13
Q3	Approve the pricing model, bands and $600 free cap	Founders	Yes (R10, R11)	Nov 13
Q4	Requests/day, GB/month and warehouse per current tenant	Ben	Yes (band check)	Nov 8
Q5	Does the gateway know warehouse size and type, and can it read warehouse state with the pass-through credential?	Michael	No (R12)	Nov 20
Q6	Control group or customer-requested pause test to prove savings?	Michael	No (R17)	Dec 15

#	Question	Owner	Blocking?	Needed by
Q7	Postgres-only customers: price on estimated compute saved, or on requests?	Founders	No	Nov 13
Q8	Pro and Enterprise meter basis: usage (cached requests or ABUs) or 20% of cost avoided? Ceiling or annual true-up for Enterprise?	Founders, Amit	No	Dec 15
Q9	What counts as a customer for Dec 17?	Abram	No	Nov 13
Q10	Pilot agreement template (30 days, extension to 90, cap after)	Amit	No	Nov 13
Q11	FDE rate, and cap on free FDE hours per small customer	Founders	No	Nov 30
Q12	Pilot-to-paid conversion target (proposed 50%)	Founders	No	Nov 13
Q13	If routing is offered, can the gateway switch warehouses per statement?	Michael	No (P2)	Q1 2027
Q14	Are the phase dates realistic (metered savings by Jan 31, self-serve by Mar 31)?	Michael	No (timeline)	Nov 20
Q15	Is within 10% the right savings accuracy target, and how is it measured?	Michael, founders	No (R17, billing the share)	Dec 15
Q16	Will AiRBRX offer warehouse routing at all, manual (FDE) or automated?	Founders	No (routing features)	Nov 13
Q17	Savings-based plan placement, or neutral plans (tenants, warehouses, users, features) with savings as proof only? Proposed: fixed plans through Business, metered Pro and Enterprise (Pricing Plan, Nov 3).	Founders	Yes (R10, R11)	Nov 13

13. Timeline and phasing

November runs manually to hit 10 customers; metering ships before savings statements go to customers.

Rollout: 3 phases, 3 gates

Hard dates: Nov 13 founder decisions, Nov 20 onboarding v3 and security one-pager, Nov 30 10 customers, Dec 17 pitch, end Dec to Jan SOC 2 Type II. Phase 2 and 3 dates are Low confidence until Michael sizes R1 to R4.

---

14. Launch readiness

Nothing goes to a prospect until every item in its row is ticked.

Product and engineering

- [ ] Savings method agreed and documented (Michael, Adam)
- [ ] Funnel events live (Ben)
- [ ] Cap stand-in tested: caching stops, queries still pass through (Michael)

Support

- [ ] Failure runbook: pass-through behavior, CNAME switch-back (Michael)
- [ ] Security and FAQ one-pager, forwardable to the decision maker (Adam, Michael)
- [ ] "How is this different from the result cache?" answer, first in the FAQ (Adam)

Legal and commercial

- [ ] Pilot agreement template (Amit)
- [ ] Free-year contract language, founder-approval only (Amit)
- [ ] Invoice template with the four-line savings statement (Adam, Amit)
- [ ] SOC 2 wording approved: "Type II expected by the end of 2026" (founders)

Marketing and sales

- [ ] Onboarding v3 live at airbrx.ai/signup.html (Adam, Abram)

- [ ] Claims approved, including Omnigent figures as a labeled internal test (founders)
- [ ] Cost calculator in credits, DBUs and compute; no savings percentages (Adam)
- [ ] Savings report template for pilot end (Adam)
- [ ] Qualification questions and objection answers loaded in Eva (Abram)

Field and FDE enablement

- [ ] Pilot ops sheet: start, length, extension, approver, weekly snapshot (Abram)
- [ ] FDE routing setup write-up template: sources, warehouses, rules, savings before and after (Michael)
- [ ] Hands-on first-call script: connect during the meeting (Abram, Adam)

---

15. Impact (fill after launch)

Did it move the north star? Filled at each review; empty until the first pilots end.

Review	Dollars avoided (all tenants, per month)	Customers (paid / pilot)	Median time to first cache hit	Savings accuracy	Verdict
Nov 30					
Dec 17 pitch					
End of Q1 2027
